

# Chain Analysis: Fastned Charging Stations

## October 2024

Responsible:  
Emily Eckhous, Fastned  
Hans de Jong, DCC

## 1. Introduction

Fastned's mission is to accelerate the transition to sustainable mobility and to improve access to renewable energy for EV drivers, therefore decreasing carbon emissions related to transportation.

However, we recognize our own carbon emissions within the value chain. In achieving (and recertifying for) Level 4 of the CO<sub>2</sub> Performance Ladder certification, in line with our sustainable mission, we are dedicated to understanding and reducing our carbon footprint. Presently, the construction of our stations is identified as a major contributor to our company's carbon footprint, which overshadows all other emission categories. Therefore, we conducted an LCA that focused on Fastned's station construction.

The Life Cycle Analysis or Assessment (LCA) is a comprehensive methodology used to evaluate the environmental impacts of a product, service, or process over its entire life cycle. An LCA involves assessing environmental impacts at all the stages of a project's life, from raw material extraction through materials processing, manufacturing, construction, use, operation, maintenance, renovation, demolition and recycling. The goal of an LCA is to identify and quantify CO<sub>2</sub> emissions to help guide decision-making toward more sustainable practices.

This document specifically focuses on emissions associated with station construction, detailing the current situation and proposing measures for better understanding and footprint reduction.

The structure of this analysis is organized as follows:

- Chapter 2: Explains the choice for this specific chain analysis
- Chapter 3: Focuses on identifying the various elements within the chain
- Chapter 4: Explains the calculation and data sources
- Chapter 5: Concentrates on quantifying the emissions within the chain
- Chapter 6: Looks at potential improvements in data
- Chapter 7: Discusses Fastned's objectives and measures

FASTNED

## 2. Scope

The Ladder requires the selection of a topic associated with the most substantial emissions, focusing on relevant emissions within the context of scope 3 as outlined in the [GHG Protocol Scope 3 Standard](#). The criteria for this selection include the following:

- The scope of the emissions
- Influence of the company on the emissions
- Risks for the company
- Influence on sector
- Emissions identified by the sector as significant/relevant and others

For Fastned, the company's entire focus is on delivering public, premium, high speed charging stations accessible to all EV drivers, without differentiating among user groups. Consequently, there is a single, relevant Product-Market Combination (PMC): **Fast charging stations for electric vehicles.**

Therefore, in this document, we are focusing on the emissions related to the whole process of the construction of the stations: from purchased materials to transportation to construction itself.

### 3. Value chain

In conducting an LCA for Fastned's charging stations, it's important to understand the various elements that constitute the value chain. This LCA helps in identifying the environmental impact at each stage of development, from initial transport to final installation. Below is a detailed overview of the key components and materials involved in the construction and operation of Fastned's charging stations. This comprehensive breakdown provides insight into the resources used.

#### 1. Transport:

- HIAB truck: Used for transporting materials, with a focus on its average diesel consumption
- Standard truck: Also involved in material transportation, with an average diesel consumption noted

#### 2. Construction:

- Fuel Consumption: The diesel used during the construction phase of the charging stations

#### 3. Foundations:

- Concrete: Fundamental material for station foundation
- Steel: Used to reinforce the concrete foundations

#### 4. Canopy:

- Timber types: Used for constructing the canopy structure
- Steel: Additional structural support for the canopy

#### 5. Canopy covers:

- Steel sheet metal
- Stainless steel sheet metal
- Aluminium
- Polystyrol
- Rubber

#### 6. PV modules:

- Materials used in the construction of solar panels
- Solar cells
- Aluminium

#### 7. Civil works:

- Various types of sand and concrete: Used in laying the groundwork and foundation for the charging stations

#### 8. Grid connection:

- Copper cables: Different types and sizes, for electrical connections

#### 9. Illumination:

- Station lighting
- LED neon flex: Energy-efficient lighting solution

#### 10. Chargers:

- Alpitronic Hypercharger 400: The main charging units used at the stations

**FASTNED**

### 3.1 Station types

The size of the construction surface (number of modules) and the number of chargers at Fastned stations both have a significant impact on emissions per station. Larger construction surfaces require more materials and energy for development, leading to higher emissions from construction activities. This includes emissions from the production of construction materials like concrete and steel, and the operation of construction machinery.

In addition, the number of chargers at a station also influences emissions. More chargers mean increased manufacturing emissions, as each charger requires materials like metals, plastics, and electronic components. The production and assembly of these chargers involve energy-intensive processes, contributing to the carbon footprint.

Therefore, larger Fastned stations, with extensive construction surfaces and numerous chargers, generally have a higher initial environmental impact due to the increased materials and manufacturing emissions.

We have four different modular station types (type 4, type 5, type 6 and type 7). Then there is also some variety in the number of modules and number of chargers per station. See here below examples of different station types.

**Figure 1.** Station type 4.2: Oude Riet, A7, Nuis

**Figure 2.** Station type 4.6: Bochum-Stahlhausen

## 4. Calculations

The conducted LCA for constructing a charging station is based on both primary and secondary data, as detailed in the table provided. Primary data is preferred for its direct relevance, but secondary data is utilized to ensure a complete assessment when the former is not available. This data aids in quantifying the carbon footprint, measured in CO<sub>2</sub>, associated with the materials and processes outlined in the table, from the start to the end of the construction phase.

Element	Material	Unit	EF (in KG)	Source
<b>Transport</b>				
	HIAB truck (average diesel consumption)	Liter	3,468	CO2emissiefactoren.nl
	Standard truck (average diesel consumption)	Liter	3,468	CO2emissiefactoren.nl
<b>Construction</b>				
	Fuel consumption during construction (diesel)	Liter	3,468	CO2emissiefactoren.nl
<b>Foundations</b>				
	Concrete	m3	427	primary data from supplier
	Steel	kg	2,34	primary data from supplier
<b>Canopy</b>				
	Glulam timber Larch	m3	87,2	primary data from supplier
	Glulam timber Spruce	m3	87,2	primary data from supplier
	Steel	kg	2,34	primary data from supplier
	Frames	kg	2,24	primary data from supplier
<b>Canopy Covers</b>				
	Steel sheet metal	kg	2,34	primary data from supplier
	Stainless steel sheet metal	kg	2,34	primary data from supplier
	Aluminium	kg	7,5	Eco-invent (see tab 'canopy covers')
	Polystyrol	kg	24,02	Eco-invent (see tab 'canopy covers')
	Rubber	kg	2,37	Eco-invent (see tab 'canopy covers')
<b>PV Modules</b>				
	TVG (heat-strengthened) glass	kg	1	GER-waardenlijst
	PVB lamination foil	m2	0,65	GER-waardenlijst
	Aluminium	kg	7,5	Eco-invent
	Panel PV modules	pcs	200	enie.nl kennisbank
<b>Civil Works</b>				
	Puinbed	m3	1,44	GER-waardenlijst
	Brekerszand	m3	1,44	GER-waardenlijst
	Schoonzand	m3	1,44	GER-waardenlijst
	Klinkers (Concrete)	m3	168	GER-waardenlijst
<b>Electrical Installation</b>				
	Copper cables (single core, cross section 150mm <sup>2</sup> )	m	1,9	GER-waardenlijst
	Copper cables (5G2,5)	m	1,9	GER-waardenlijst
<b>Chargers</b>				
	Alpitronic Hypercharger 300	pcs	13039,16	FFE

## 5. Emissions

To accurately measure Fastned's CO<sub>2</sub> emissions, we first calculated the emissions for each station type across various categories. This approach considers factors like construction materials, fuel use and material transportation, as described in the previous chapter.

Station type	Emissions per station type in kg CO <sub>2</sub> (excluding transport and charger): <b>2023</b>	<b>2022</b>
4	57,850	55,805
5	3,894	3,752
6	31,358	29,149
7	52,834	49,875

The variety in station types is evident in the number of chargers and modules they offer, resulting in a diverse range of station setups. For detailed information, please refer to our Life Cycle Assessment (LCA) document. We have calculated that each charger contributes 13,039 kilograms (~13.04 tonnes) of CO<sub>2</sub> emissions. Additionally, the emissions from transportation vary depending on the specific location of each station.

After determining the emissions per station type, we then extrapolated these figures to all stations built in 2023. This step is key to estimating the total environmental impact of our network expansion in that year.

In 2023, we constructed 58 stations across different European countries. By applying the emissions data to these 58 stations, we estimated the total 2022 carbon footprint for the construction of Fastned stations to be approximately **8,851 tonnes** of CO<sub>2</sub>. This figure reflects the environmental impact of our expansion and is a significant aspect of our overall sustainability evaluation.

## 7. Objectives & Measures

The goals set for reducing CO<sub>2</sub> emissions per kilowatt-hour (kWh) sold are substantial and indicative of a commitment to environmental sustainability. Updated in 2024 to align more closely with the CO<sub>2</sub> Performance Ladder handbook, the first objective for our charging station construction (Scope 3 - Capital Goods) is to achieve a 40% reduction in CO<sub>2</sub> emissions per kWh by 2025, using 2022 as the baseline.

The second goal is more extensive, aiming for a 60% reduction by 2030, again using 2022 as the baseline. This long-term target suggests a deeper commitment to reducing the environmental impact over the next eight years.

Overall, these targets are aligned with global efforts to address climate change, setting a clear path towards reducing greenhouse gas emissions and enhancing sustainability. In sum:

- By 2025, reduce CO<sub>2</sub> emissions/kWh sold by **40%** (compared to 2022 as base year)
- By 2030, reduce CO<sub>2</sub> emissions/kWh sold by **60%** (compared to 2022 as base year)

### Progress

	2023	2022	% change (2023 vs. 2022)	Reduction
Emissions in tonnes	8.851,03	8.416,74	105%	-5% (increase)
Total kWh sold/year or period	99.600.000	51.900.000	192%	
tonnes CO <sub>2</sub> /kWh sold	0,00008887	0,0001622	55%	45%

### 7.1 Measures

To not only improve our understanding but to also actively reduce carbon emissions in the construction process, we have taken actions and measures which are still in progress.

#### Implemented

##### 1. Optimizing foundation size per location

We've optimized the size of concrete foundations for stations in Spain based on specific site needs. This modular approach will be expanded to other markets, reducing material usage and CO<sub>2</sub> footprint.

#### In progress

##### 2. LED strips

We are transitioning LED strip production from Asia to Poland, with promising samples already received. Adjustments are being made to meet quality standards.

##### 3. Screw-in foundations for tiny shops

We are replacing concrete foundations with steel screw foundations for tiny shops, aiming to reduce material use. CO<sub>2</sub> savings from this switch are under review.

##### 4. Reduction of voltaic boxes per station

We're working on reducing the number of voltaic boxes, aiming to use one box for every two panels to improve efficiency.

### Investigating

5. **Alternative design for steel frames**

We're exploring a new design for steel frames that could reduce steel use by 20-30%, pending further engineering analysis.

6. **Leaner station frames**

For 2025, we are considering a redesign of station frames to use less steel, aiming to reduce the overall footprint. CO<sub>2</sub> savings are still being assessed.

### Implementing

7. **New software**

We are rolling out a new planning tool in late 2024/early 2025, featuring a dashboard to track progress on reducing Scope 3 emissions.
